AIF7002 AI Foundations in Practice
Assessment 1: AI Systems Case Study

School of Computing, Northbridge University (2026-27, Teaching Block 1)

Key information

Weighting: 40% of the module mark.
Submission deadline: Wednesday 18 November 2026, 12:00 (UK time).
Submit a single PDF through the Assessment 1 submission point on the module page.
Word limit: 2,000 words, excluding references and appendices.
Module leader: Dr Lena Moreau (l.moreau@northbridge.example).

Overview

Choose one AI system that is already in use, such as a triage chatbot, a fraud detection service or a route-planning assistant, and analyse it as a whole system: the model, the data it depends on, the people who use it and the people it affects.

The task

Your case study should open by identifying the AI system, the task it performs and the people it is intended to serve. Describe the system as it is actually used rather than as it is marketed, drawing only on publicly available information; do not contact the organisation.

The core of the case study is analytical. You should discuss the limitations of the underlying model and explain when its outputs should not be trusted, using concrete examples where you can find them. Building on that analysis, you must evaluate the ethical and operational risks the system creates for the people who use it or are affected by it, and weigh how likely and how serious each risk is.

Finally, you should propose practical safeguards that would reduce the most serious of those risks. Strong answers explain who would carry out each safeguard and what it would cost the organisation, rather than listing good intentions.

Assessment criteria

Marks are allocated to the description of the system and its intended users (20%), the analysis of model limitations (25%), the evaluation of risk (30%), the proposed safeguards (20%), and presentation and referencing (5%).

Support

The Week 2 lecture and the risk workshop cover the material for this case study.
